cause of prominent neurological symptoms including weakness, sensory loss, pain and autonomic dysfunction associated with deficits, morbidity and mortality. These disorders may be primary hereditary or cryptogenic neurologic disorders confined to the PNS or part of the pathology of both the central nervous system and the PNS. Most PNS disorders are secondary to other system disorders and may be responsive to treatment of the primary disease. Important advances have been obtained in several areas including molecular genetics, biochemistry, immunology, morphology and physiology that have enhanced our understanding of the causes and consequences of damage to peripheral nerve. Understanding of both these groups of PNS diseases has greatly expanded over recent years and has led

Textbook of Peripheral Neuropathy is a practical but complete reference for neurologists in general practice who are evaluating patients with peripheral neuropathy. The book covers a broad range of neuropathies including mononeuropathy, mononeuritis multiplex, and polyneuropathy (which accounts for the greatest number of cases) and provides an evidence-based approach to testing, diagnosis, and treatment. The chapters are written by internationally renowned expert contributors with deep clinical experience and contain numerous tables, figures, and algorithms for quick access to key information. The book covers both inherited and acquired diseases, including neuropathies arising from physical injury, diabetes, alcoholism, toxins,

Peripheral neuropathy, the variety of conditions that result when the nerves that connect to the brain and spinal cord are damaged or diseased, is commonly associated with diseases such as diabetes, HIV, alcoholism, and lupus. Although widespread -- it affects 10-20 million people in the United States -- information about the condition has been difficult to obtain. This essential guide explains what is known about peripheral neuropathy, including its causes and manifestations, and what can be done to manage it. Topics include drug therapy for the condition and its symptoms,

interventional therapy, alternative medicines, caring for the feet, and much more. This book will enable patients to make informed decisions about their care.

Provides practical advice to help successfully manage diabetes and reduce the risk of serious complications, discussing monitoring blood sugar, developing an eating plan, achieving a healthy weight, and diabetes in children.

NOTE: This addition to the description is being added due to the possibility of bogus reviews implying that only one type of peripheral neuropathy is addressed within this book. addressed also include: neuropathies affecting sensory, motor and autonomic nerves, polyneuropathy and mono-neuropathy, thyroid disease neuropathies, peripheral neuropathies of autoimmune and systemic diseases (e.g. Lupus, Celiac Disease, Rheumatoid Arthritis, Sjogren's Syndrome, Peripheral Artery Disease), peripheral neuropathy of viral cause, also known as "Chronic Inflammatory Demyelinating Polyneuropathy" (e.g. Cytomegalovirus, Epstein-Barr, Varicella Zoster, Hepatitis Viruses A, B, C, D, and E, Campylobacter Jejuni). Additionally, a chapter is dedicated to nutritional deficiencies -- literally from A to Z, that cause or contribute to neuropathies. number is much higher when worldwide statistics are considered. A major reason for the rise in incidence for these conditions of damage to the nerves in the body that results in pain and dysfunction in them is the increase in cases of diabetes and pre-diabetic syndromes. There are many other causes of PN however, including old age, viral infections, nutritional deficiencies, various autoimmune diseases, dysfunction of the arterial system (blood circulation) and drug-use of both prescribed types and varieties of illegal drugs. Within the chapters of this book, I address the types of symptoms involved in PN diseases, the types of nerves that can be affected and treatments that are administered to treat underlying causes of PN and to directly address its symptoms. Written by one of the world's leading experts — Professor Gérard Said MD FRCP, Dpt de Neurologie, Hôpital de la Salpêtrière, Paris, France Peripheral neuropathy is a common medical condition, the diagnosis of which is often protracted or delayed. It is not always easy to relate a neuropathy to a specific cause. Many people do not receive a full diagnosis, their neuropathy often being described as 'idiopathic' or 'cryptogenic'. It is said that in Europe, one of the most common causes is diabetes mellitus but there are also many other known potential causes. The difficulty of diagnosis, the limited number of treatment options, a perceived lack of

knowledge of the subject —except in specialised clinics, the number of which are limited — all add to the difficulties which many neuropathy patients have to face. Another additional problem for many patients is that once having received a full, or even a partial diagnosis, they are then often discharged back to their primary healthcare team who, in many instances, know little about this condition and how it may impact upon their patients' lives. In order to help bridge this gap in medical knowledge and to give healthcare providers a better understanding of this often distressing condition, The Neuropathy Trust has commissioned a new book on this complex topic. Written by one of the world's leading experts on neuropathy, Professor Gérard Said, it is a 'must read' and also a handy reference book for doctors, nurses,

physiotherapists, chiropodists/podiatrists and other health professionals. As well as covering the anatomy of the nervous system and the basic pathological processes that may affect the peripheral nerves, the book covers a whole range of neuropathic conditions. These include, for example, Guillain-Barré syndrome, chronic inflammatory demyelinating polyneuropathy, vasculitic neuropathies, infectious neuropathies, diabetic and other metabolic neuropathies, hereditary neuropathies and neuropathies in patients with cancer. Given the almost explosive increase in diabetes predicted over the coming years and the high incidence of HIV infections alone, not to mention all the other possible causes of peripheral neuropathy, no self-respecting medical unit should be without a copy of this new book on their

shelves. The author, Professor Gérard Said, is based in the Department of Neurology at the prestigious Hôpital de la Salpêtrière in Paris. He has devoted a lifetime to the study of peripheral neuropathy and — alongside other great neurological names — added much to the world's ever-growing store of knowledge on this complex but fascinating condition which affects so many individuals.
